■ MATERIAL

■ SPECIFICATION

1/2" - 2"

Inlet pressure: up to 40 bar **Outlet pressure:** 0.5 to 15 bar depending on version

■ SUITABLE FOR

Liquids	neutral and non-neutral	
Air, gases and vapours	neutral and non-neutral	
Potable water cold	up to 40°C	
Potable water hot	up to 95°C	

■ EXAMPLES OF USE

For the protection of:

- domestic water supply systems
- commercial and industrial plants

against too high supply pressure.

Pressure reducers are used, if within a piping system despite of varying pressures on the inlet side a certain pressure must not be exceeded on the outlet side.

- potable water supply according to DIN 1988
- process water supply in industrial- and building technology
- snow-making equipment
- · fire-fighting equipment and sprinkler systems
- shipbuilding industry and offshore plants
- secondary areas in the food-, pharmaceutical- and cosmetics- industries.

■ APPROVALS

Series 481 ■ VALVE VERSION

m with diaphragm High-quality, heat-resistant moulded elastomere, fabric-reinforced diaphragm.

Pressure adjustment by means of non-rising spindle.

Valve insert with balanced single seat valve completely made of stainless steel.

Complete valve insert SP/HP (order code: 481 Insert-DN..-seal) available as replacement part can be exchanged without removing the valve.

Complete valve insert LP (order code: 481 LP Insert-DN..-seal) available as replacement part can be exchanged without removing the valve.

Built-in dirt trap made of stainless steel.

Mesh size:

DN 15 to DN 32 DN 40 and DN 50 0,60 mm 0,75 mm

■ MEDIUM

GF gaseous and liquid for water and distilled water, neutral and non-sticking liquids, compressed air and neutral gases; optionally with FPM elastomere seals for non-neutral media i.e. oils, fuels, oil-laden compressed air etc. Not suitable with steam.

■ TYPE OF LIFTING MECHANISM

Series 481:

Dimensioning by pressure loss on the outlet pressure side

Flow chart water

Dimensioning by flow velocity

With help of the chart you can determine the nominal diameter (DN) for a given flow volume V (m³/h). According to DVGW-guidelines (DIN 1988) a flow velocity of 2 m/s in domestic water supply systems should not be exceeded.

For compressed air and other gaseous media:

The usual flow velocity for compressed air is 10 - 20 m/s. For gaseous media the flow volume V should always be shown in actual cubic meters/hour. If the flow volume is given in standard cubic meters, these should be converted into actual cubic meters before using the diagram.

$$V\left(m^{3}/h\right) = \frac{V_{\text{Norm}}\left(Nm^{3}/h\right)}{p_{\text{absolut}}\left(bar\right)} = \frac{V_{\text{Norm}}}{p_{\ddot{\upsilon}} + 1}$$

Actual cubic meters are based on the prevailing pressure of the medium on the outlet side of the pressure reducer.
